

# GUIDINGSIGNS® ANALYTICS

## Transform Data into Actionable Insights

GuidingSigns® Analytics is a clinical decision support system integrated into the GuidingCare® platform for the transformation of data into actionable insights. GuidingSigns combines gaps-in-care analytics with predictive risk scoring, stratification and grouping, to identify opportunities for evidence-based health improvement. This works across hundreds of clinical care and behavioral health indicators.

### ALIGN CARE MANAGEMENT AND RESOURCE REQUIREMENTS

Altruista clients can modify factors like risk scoring and weighting based on program requirements and available resources. This ensures deployment of the right care management strategies to the right members at the right time.

### FINE-TUNE RISK ASSIGNMENT

GuidingSigns can incorporate additional risk data, and weight its impact on an overall population risk score. For example, health risk assessment tools can reveal social determinants of health that become part of a larger health picture.

### SEAMLESSLY LINK ANALYTICS WITH CARE PLANS

GuidingSigns is extensively integrated with the Altruista Care Management module. Analytics output is directly populated into relevant fields and automates patient-specific care plans. Output includes risk scores, condition-based risk groupings, gaps in care and corresponding service and education interventions.

### BUILT-IN CDPS RISK MODEL

Embedded within GuidingSigns is the Chronic Illness and Disability Payment System (CDPS), a predictive risk model that interprets diagnostic and pharmacy data to assign segments of a population into more than 60 risk categories. CDPS is available exclusively for commercial use within GuidingCare.

# GUIDINGSIGNS® ANALYTICS

## Deploy the Right Care, to the Right Members, at the Right Time

GuidingSigns features the CDPS predictive risk model, which can incorporate additional risk determinants. CDPS can factor in income, social determinants of health and specific assessment scores for more holistic and accurate risk identification. These factors can be individually weighted against population data so care managers can identify individuals at the greatest risk for costs and complications. Those individuals can be targeted for care programs, allowing you to intervene with the right members at the right time.

## Identify Individuals at the Greatest Risk
