

MOBILE CLINICIAN

Enable Effective Care Management in the Field

The GuidingCare® Mobile Clinician application allows users to perform care management functions with Windows and iOS devices. Mobile Clinician provides access online and offline, so users in the field can continue to work with members and capture their information even when internet service is unavailable. Seamless integration with other GuidingCare modules streamlines activity scheduling, referrals and other care coordination functions.

ELECTRONIC SIGNATURE SUPPORT

Once care plans and service plans have been created, Mobile Clinician users can capture electronic signatures for member consent and service plan acceptance – all in the same member visit.

STREAMLINED DATA ENTRY

Mobile Clinician allows users to perform assessments that capture valuable care planning information. Less time is spent entering data, and more time is spent with patients, because the application auto-populates data for interrelated questions within the assessment tool.

INTEGRATION OF SOCIAL DETERMINANTS

With social determinants of health (SDOH) causing more than 40 percent of the healthcare spend among vulnerable populations, many assessments are embedded in the app to identify SDOH factors that might present barriers to better care. Clinicians and care managers can rely on social services directories to make referrals to social support providers.

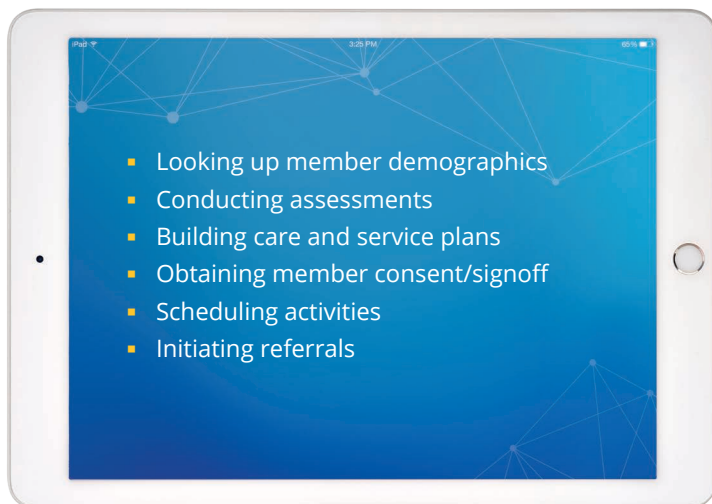

SECURE & ENCRYPTED OFFLINE ACCESS

When internet connectivity is unavailable, Mobile Clinician still allows field-based staff to access member details and key functions with fully encrypted upload and download processes.

MOBILE CLINICIAN

Connect with Members Anytime, Anywhere

Mobile Clinician makes it possible to securely access member details and key functions from mobile devices anytime, anywhere. Staff can perform many of the same care management functions in Mobile Clinician as they do in the browser-based platform, including:
